

Project Brief

New Plymouth Boys High Moyes House

New Plymouth, NZ
2005

Both levels of this two story building required shear enhancement to the walls due to insufficient steel. Tyfo® SEH 51A was applied with one layer vertical and one layer horizontal. The Fibrwrap was broadcast with aggregate to provide a key coat and plastered over, making the FYFE structural enhancement a totally unobtrusive installation.

Negligible additional weight was added to the structure and no usable space was lost.

The substrate prep was completed by a specialist, local demolition and preparation company who understand the level of prep required for the installation of the Tyfo® systems.
